FICTIONAL DEMO DOCUMENT - not real data
Kestrel Field Facilities Study (Marrow Basin, fictional)
Prepared by Tallgrass Fictional Energy, Facilities Engineering.

1. Central tank battery
The central tank battery has three 500 barrel oil tanks and two 400 barrel water tanks.
The inlet separator is rated for 15,000 barrels per day of total liquid.
Oil is sold by truck. Trucks collect on Tuesdays and Fridays.

2. Gas compression

A single-stage reciprocating compressor was installed in 2019 and is rated for 2.4 MMscf per day.

The availability target for the compressor is 95 percent.

The compressor runs on grid power. A 250 kW diesel generator provides backup.

3. Produced water handling

Produced water is injected into the disposal well Kestrel-D1 at an average of 9,800 barrels per day. The permitted maximum injection rate for Kestrel-D1 is 12,000 barrels per day.

The study recommends adding a second water filter skid in the fourth quarter of 2026, at an estimated cost of 1.2 million USD.
